Abstract

Many¹ applications in machine learning and data mining require computing pairwise l_p distances in a data matrix $\mathbf{A} \in \mathbb{R}^{n \times D}$. For massive high-dimensional data, computing all pairwise distances of $\mathbf{A}$ can be infeasible. In fact, even storing $\mathbf{A}$ or all pairwise distances of $\mathbf{A}$ in the memory may be also infeasible.

For $0 < p \leq 2$, efficient small space algorithms exist, for example, based on the method of *stable random projections*, which unfortunately is not directly applicable to $p = 3, 4, 5, 6, \dots$. This paper proposes a simple method for $p = 2, 4, 6, \dots$. We first decompose the l_p (where p is even) distances into a sum of 2 marginal norms and $p - 1$ “inner products” at different orders. Then we apply normal or sub-Gaussian random projections to approximate the resultant “inner products,” assuming that the marginal norms can be computed exactly by a linear scan.

We propose two strategies for applying random projections. The basic projection strategy requires only one projection matrix but it is more difficult to analyze, while the alternative projection strategy requires $p - 1$ projection matrices but its theoretical analysis is much easier. In terms of the accuracy, at least for $p = 4$, the basic strategy is always more accurate than the alternative strategy if the data are non-negative, which is common in reality.

1 Introduction

This study proposes a simple method for efficiently computing the l_p distances in a massive data matrix $\mathbf{A} \in \mathbb{R}^{n \times D}$ for $p > 2$ (where p is even), using *random projections*[22].

While many previous work on random projections focused on approximating the l_2 distances (and inner products), the method of *symmetric stable random projections*[8, 13, 18, 15] is applicable to approximating the l_p distances for all $0 < p \leq 2$. This work proposes using random projections for $p > 2$, at least for some special cases.

¹First draft Dec. 2007. Slightly revised June 2008.

Machine learning algorithms often operate on the l_p distances of $\mathbf{A}$ instead of the original data. A straightforward application would be searching for the nearest neighbors using l_p distance. The l_p distance is also a basic loss functions for quality measure. The widely used “kernel trick,” (e.g., for support vector machines (SVM)), is often constructed on top of the l_p distances[21].²

Here we can treat p as a *tuning* parameter. It is common to take $p = 2$ (*Euclidian* distance), or $p = \infty$ (*infinity* distance), $p = 1$ (*Manhattan* distance), or $p = 0$ (*Hamming* distance); but in principle any p values are possible. In fact, if there is an efficient mechanism to compute the l_p distances, then it becomes affordable to tune learning algorithms for many values of p for the best performance.

In modern data mining and learning applications, the ubiquitous phenomenon of “massive data” imposes challenges. For example, pre-computing and storing all pairwise l_p distances in memory at the cost $O(n^2)$ can be infeasible when $n > 10^6$ (or even just 10^5)[5]. For ultra high-dimensional data, even just storing the whole data matrix can be infeasible. In the meanwhile, modern applications can routinely involve millions of observations; and developing scalable learning and data mining algorithms has been an active research direction. One commonly used strategy in current practice is to compute the distances **on the fly**[5], in stead of storing all pairwise l_p distances.

Data reduction algorithms such as sampling or sketching methods are also popular. While there have been extensive studies on approximating the l_p distances for $0 < p \leq 2$, $p > 2$ can be useful too. For example, because the normal distribution is completely determined by its first two moments (mean and variance), we can identify the non-normal components of the data by analyzing higher moments, in particular, the fourth moments (i.e., *kurtosis*). Thus, the fourth moments are critical, for example, in the field of *Independent Component Analysis (ICA)*[11]. Therefore, it is viable to use the l_p distance for $p > 2$ when lower order distances can not efficiently differentiate data.

It is unfortunate that the family of *stable distributions*[24] is limited to $0 < p \leq 2$ and hence we can not directly using *stable distributions* for approximating the l_p distances. In the theoretical CS community, there have been many studies on approximating the l_p norms and distances[2, 10, 9, 12, 3, 7, 19, 20, 4, 23, 14], some of which also applicable to the l_p distances (e.g., comparing two long vectors). Those papers proved that small space ($\tilde{O}(1)$) algorithms exist only for $0 < p \leq 2$.

1.1 The Methodology

Given a giant data matrix $\mathbf{A} \in \mathbb{R}^{n \times D}$, we assume that a linear scan of the data is feasible, but computing all pairwise interactions is not, either due to computational budget constraints or memory limits. Also, we only consider even $p = 4, 6, \dots$, among which $p = 4$ is probably the most important.

Interestingly, our method is based only on normal (or normal-like) projections. The observation is that, when p is even, the l_p distance can be decomposed into marginal

²It is well-known that the radial basis kernel using the l_p distance with $0 < p \leq 2$ satisfies the Mercer’s condition. However, we can still use the l_p distance with $p > 2$ as kernels, although in this case it is not guaranteed to find the “most optimal” solution. For very large-scale learning, we usually will not find the “most optimal” solution any way.

l_p norms and “inner products” of various orders. For example, for two D -dimensional vectors x and y , when $p = 4$, then

$$d_{(p)} = \sum_{i=1}^D |x_i - y_i|^p = \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + 6 \sum_{i=1}^D x_i^2 y_i^2 - 4 \sum_{i=1}^D x_i^3 y_i - 4 \sum_{i=1}^D x_i y_i^3.$$

Since we assume that a linear scan of the data is feasible, we can compute $\sum_{i=1}^D x_i^4$ and $\sum_{i=1}^D y_i^4$ exactly. We can approximate the interaction terms $\sum_{i=1}^D x_i^2 y_i^2$, $\sum_{i=1}^D x_i^3 y_i$, and $\sum_{i=1}^D x_i y_i^3$ using normal (or normal-like) random projections. Therefore, for p being even, we are able to efficiently approximate the l_p distances.

1.2 Paper Organization

Section 2 concerns using normal random projections for approximating l_4 distances. We introduce two projection strategies and the concept of utilizing the marginal norms to improve the estimates. Section 3 extends this approach to approximating l_6 distances. Section 4 analyzes the effect of replacing normal projections by sub-Gaussian projections.

2 Normal Random Projections for $p = 4$

The goal is to efficiently compute all pairwise l_p ($p = 4$) distances in $\mathbf{A} \in \mathbb{R}^{n \times D}$. It suffices to consider any two rows of $\mathbf{A}$, say x and y , where $x, y \in \mathbb{R}^D$. We need to estimate the l_p distance between x and y

$$d_{(p)} = \sum_{i=1}^D |x_i - y_i|^p.$$

which, when $p = 4$, becomes

$$d_{(4)} = \sum_{i=1}^D |x_i - y_i|^4 = \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + 6 \sum_{i=1}^D x_i^2 y_i^2 - 4 \sum_{i=1}^D x_i^3 y_i - 4 \sum_{i=1}^D x_i y_i^3.$$

In one pass, we can compute $\sum_{i=1}^D x_i^4$ and $\sum_{i=1}^D y_i^4$ easily, but computing the interactions is more difficult. We resort to random projections for approximating $\sum_{i=1}^D x_i^2 y_i^2$, $\sum_{i=1}^D x_i^3 y_i$, and $\sum_{i=1}^D x_i y_i^3$. Since there are three “inner products” of different orders, we can choose either only one projection matrix for all three terms (the basic projection strategy), or three independent projection matrices (the alternative projection strategy).

2.1 The Basic Projection Strategy

First, generate a random matrix $\mathbf{R} \in \mathbb{R}^{D \times k}$ ($k \ll D$), with i.i.d. entries³ from a standard normal, i.e.,

$$\begin{aligned} r_{ij} &\sim N(0, 1), \quad \mathbb{E}(r_{ij}) = 0, \quad \mathbb{E}(r_{ij}^2) = 1, \quad \mathbb{E}(r_{ij}^4) = 3. \\ \mathbb{E}(r_{ij}^s r_{i'j'}^t) &= 0, \quad \text{if } t \text{ or } s \text{ is odd, and } i \neq i' \text{ or } j \neq j' \end{aligned}$$

Using random projections, we generate six vectors in k dimensions, $u_1, u_2, u_3, v_1, v_2, v_3 \in \mathbb{R}^k$:

$$\begin{aligned} u_{1,j} &= \sum_{i=1}^D x_i r_{ij}, \quad u_{2,j} = \sum_{i=1}^D x_i^2 r_{ij}, \quad u_{3,j} = \sum_{i=1}^D x_i^3 r_{ij}, \\ v_{1,j} &= \sum_{i=1}^D y_i r_{ij}, \quad v_{2,j} = \sum_{i=1}^D y_i^2 r_{ij}, \quad v_{3,j} = \sum_{i=1}^D y_i^3 r_{ij}. \end{aligned}$$

We have a simple unbiased estimator of $d_{(4)}$

$$\hat{d}_{(4)} = \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} (6u_2^\top v_2 - 4u_3^\top v_1 - 4u_1^\top v_3).$$

Lemma 1

$$\mathbb{E}(\hat{d}_{(4)}) = d_{(4)},$$

$$\begin{aligned} \text{Var}(\hat{d}_{(4)}) &= \frac{36}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 \right) \\ &\quad + \frac{16}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^3 y_i \right)^2 \right) \\ &\quad + \frac{16}{k} \left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i y_i^3 \right)^2 \right) + \Delta_4 \end{aligned}$$

$$\begin{aligned} \Delta_4 &= -\frac{48}{k} \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 \right) \\ &\quad - \frac{48}{k} \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 \right) \\ &\quad + \frac{32}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 \right). \end{aligned}$$

³It is possible to relax the requirement of i.i.d samples. In fact, to prove unbiasedness of the estimates only needs pairwise independence, and to derive the variance formula requires four-wise independence.

Proof 1 See Appendix A. $\square$

The basic projection strategy is simple but its analysis is quite involved, especially when $p > 4$. Also, if we are interested in higher order moments (other than variance) of the estimator, the analysis becomes very tedious.

2.2 The Alternative Projection Strategy

Instead of one projection matrix $\mathbf{R}$, we generate three, $\mathbf{R}^{(a)}$, $\mathbf{R}^{(b)}$, $\mathbf{R}^{(c)}$, independently. By random projections, we generate six vectors in k dimensions, $u_1, u_2, u_3, v_1, v_2, v_3 \in \mathbb{R}^k$, such that

$$\begin{aligned} u_{1,j} &= \sum_{i=1}^D x_i r_{ij}^{(c)}, \quad u_{2,j} = \sum_{i=1}^D x_i^2 r_{ij}^{(a)}, \quad u_{3,j} = \sum_{i=1}^D x_i^3 r_{ij}^{(b)}, \\ v_{1,j} &= \sum_{i=1}^D y_i r_{ij}^{(b)}, \quad v_{2,j} = \sum_{i=1}^D y_i^2 r_{ij}^{(a)}, \quad v_{3,j} = \sum_{i=1}^D y_i^3 r_{ij}^{(c)}. \end{aligned}$$

Here we abuse the notation slightly by using the same u and v for both projection strategies.

Again, we have an unbiased estimator, denoted by $\hat{d}_{(4),a}$

$$\hat{d}_{(4),a} = \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} (6u_2^T v_2 - 4u_3^T v_1 - 4u_1^T v_3)$$

Lemma 2

$$E(\hat{d}_{(4),a}) = d_{(4)},$$

$$\begin{aligned} \text{Var}(\hat{d}_{(4),a}) &= \frac{36}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 \right) \\ &\quad + \frac{16}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^3 y_i \right)^2 \right) \\ &\quad + \frac{16}{k} \left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i y_i^3 \right)^2 \right). \end{aligned}$$

Proof 2 The proof basically follows from that of Lemma 1.

Compared with $\text{Var}(\hat{d}_{(4)})$ in Lemma 1, the difference would be Δ_4

$$\begin{aligned}
& \text{Var}(\hat{d}_{(4)}) - \text{Var}(\hat{d}_{(4),a}) = \Delta_4 \\
&= -\frac{48}{k} \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 \right) \\
&\quad - \frac{48}{k} \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 \right) \\
&\quad + \frac{32}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 \right), \tag{1}
\end{aligned}$$

which can be either negative or positive. For example, when all x_i 's are negative and all y_i 's are positive, then $\Delta_4 \geq 0$, i.e., the alternative projections strategy results in smaller variance and hence it should be adopted.

We can show in Lemma 3 that when the data are non-negative (which is more likely the reality), the difference in (1) will never exceed zero, suggesting that the basic strategy would be preferable, which is also operationally simpler (although more sophisticated in the analysis).

Lemma 3 *If all entries of x and y are non-negative, then*

$$\text{Var}(\hat{d}_{(4)}) - \text{Var}(\hat{d}_{(4),a}) = \Delta_4 \leq 0. \tag{2}$$

Proof 3 See Appendix B. $\square$.

Thus, the main advantage of the alternative projection strategy is that it simplifies the analysis, especially true when $p > 4$. Also, analyzing the alternative projection strategy may provide an estimate for the basic projection strategy. For example, the variance of $\hat{d}_{(4),a}$ is an upper bound of the variance of $\hat{d}_{(4)}$ in non-negative data.

In the next subsection, we show that the alternative strategy make the analysis feasible when we take advantage of the marginal information.

2.3 Improving the Estimates Using Margins

Since we assume that a linear scan of the data is feasible and in fact the estimators in both strategies already take advantage of the marginal l_4 norms, $\sum_{i=1}^D x_i^4$ and $\sum_{i=1}^D y_i^4$, we might as well compute other marginal norms and try to take advantage of them in a systematic manner.

Lemma 4 demonstrates such a method for improving estimates using margins. For simplicity, we assume in Lemma 4 that we adopt the alternative projection strategy, in order to carry out the (asymptotic) analysis of the variance.

Lemma 4 Suppose we use the alternative projection strategy described in Section 2.2 to generate samples $u_{1,j}$, $u_{2,j}$, $u_{3,j}$, $v_{1,j}$, $v_{2,j}$, and $v_{3,j}$. We estimate $d_{(4)}$ by

$$\hat{d}_{(4),a,mle} = \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + 6\hat{a}_{2,2} - 4\hat{a}_{3,1} - 4\hat{a}_{1,3},$$

where $\hat{a}_{2,2}$, $\hat{a}_{3,1}$, $\hat{a}_{1,3}$, are respectively, the solutions to the following three cubic equations:

$$\begin{aligned} a_{2,2}^3 - \frac{a_{2,2}^2}{k} u_2^T v_2 - \frac{1}{k} \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 u_2^T v_2 \\ + a_{2,2} \left(- \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 \right) + \frac{a_{2,2}}{k} \left(\sum_{i=1}^D x_i^4 \|v_2\|^2 + \sum_{i=1}^D y_i^4 \|u_2\|^2 \right) = 0. \end{aligned}$$

$$\begin{aligned} a_{3,1}^3 - \frac{a_{3,1}^2}{k} u_3^T v_1 - \frac{1}{k} \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 u_3^T v_1 \\ + a_{3,1} \left(- \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 \right) + \frac{a_{3,1}}{k} \left(\sum_{i=1}^D x_i^6 \|v_1\|^2 + \sum_{i=1}^D y_i^2 \|u_3\|^2 \right) = 0. \end{aligned}$$

$$\begin{aligned} a_{1,3}^3 - \frac{a_{1,3}^2}{k} u_1^T v_3 - \frac{1}{k} \sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 u_1^T v_3 \\ + a_{1,3} \left(- \sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 \right) + \frac{a_{1,3}}{k} \left(\sum_{i=1}^D x_i^2 \|v_3\|^2 + \sum_{i=1}^D y_i^6 \|u_1\|^2 \right) = 0. \end{aligned}$$

Asymptotically (as $k \rightarrow \infty$), the variance would be

$$\begin{aligned} & \text{Var} \left(\hat{d}_{(4),a,mle} \right) \\ &= 36 \text{Var}(\hat{a}_{2,2}) + 16 \text{Var}(\hat{a}_{2,2}) + 16 \text{Var}(\hat{a}_{2,2}) \\ &= \frac{36}{k} \frac{\left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 - \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 \right)^2}{\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2} \\ &+ \frac{16}{k} \frac{\left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 - \left(\sum_{i=1}^D x_i^3 y_i \right)^2 \right)^2}{\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^3 y_i \right)^2} \\ &+ \frac{16}{k} \frac{\left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 - \left(\sum_{i=1}^D x_i y_i^3 \right)^2 \right)^2}{\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i y_i^3 \right)^2} + O\left(\frac{1}{k^2}\right) \end{aligned}$$

Proof 4 [16, 17] proposed taking advantage of the marginal l_2 norms to improve the estimates of l_2 distances and inner products. Because we assume the alternative projection strategy, we can analyze $\hat{a}_{2,2}$, $\hat{a}_{3,1}$, and $\hat{a}_{1,3}$, independently and then combine the results; and hence we skip the detailed proof.

Of course, in practice, we probably still prefer the basic projection strategy, i.e., only one projection matrix instead of three. In this case, we still solve three cubic equations, but the precise analysis of the variance becomes much more difficult. When the data are non-negative, we believe that $\text{Var}(\hat{d}_{(4),a,mle})$ will also be the upper bound of the estimation variance using the basic projection strategy, which can be easily verified by empirical results (not included in the current report).

Solving cubic equations is easy, as there are closed-form solutions. We can also solve the equations by iterative methods. In fact, it is common practice to do only a one-step iteration (starting with the solution without using margins), called “one-step Newton-Rhapson” in statistics.

3 Normal Random Projections for P=6

For higher p (where p is even), we can follow basically the same procedure as for $p = 4$. To illustrate this, we work out an example for $p = 6$. We only demonstrate the basic projection strategy.

The l_6 distance can be decomposed into 2 marginal norms and 5 inner products at various orders:

$$\begin{aligned} d_{(6)} = & \sum_{i=1}^D x_i^6 + \sum_{i=1}^D y_i^6 - 20 \sum_{i=1}^D x_i^3 y_i^3 \\ & + 15 \sum_{i=1}^D x_i^2 y_i^4 + 15 \sum_{i=1}^D x_i^4 y_i^2 - 6 \sum_{i=1}^D x_i^5 y_i - 6 \sum_{i=1}^D x_i y_i^5 \end{aligned}$$

Generate one random projection matrix $\mathbf{R} \in \mathbb{R}^{D \times k}$, and

$$\begin{aligned} u_{1,j} &= \sum_{i=1}^D x_i r_{ij}, u_{2,j} = \sum_{i=1}^D x_i^2 r_{ij}, u_{3,j} = \sum_{i=1}^D x_i^3 r_{ij}, \\ u_{4,j} &= \sum_{i=1}^D x_i^4 r_{ij}, u_{5,j} = \sum_{i=1}^D x_i^5 r_{ij}, \\ v_{1,j} &= \sum_{i=1}^D y_i r_{ij}, v_{2,j} = \sum_{i=1}^D y_i^2 r_{ij}, v_{3,j} = \sum_{i=1}^D y_i^3 r_{ij}, \\ v_{4,j} &= \sum_{i=1}^D y_i^4 r_{ij}, v_{5,j} = \sum_{i=1}^D y_i^5 r_{ij}. \end{aligned}$$

Lemma 5 provide the variance of the following unbiased estimator of $d_{(6)}$:

$$\begin{aligned}\hat{d}_{(6)} &= \sum_{i=1}^D x_i^6 + \sum_{i=1}^D y_i^6 + \frac{1}{k} \left(-20u_3^T v_3 + 15u_4^T v_2 + 15u_2^T v_4 - 6u_5^T v_3 - 6u_1^T v_5 \right) \\ &= \sum_{i=1}^D x_i^6 + \sum_{i=1}^D y_i^6 + \frac{1}{k} \sum_{j=1}^k -20u_{3,j} v_{3,j} + 15u_{2,j} v_{4,j} + 15u_{4,j} v_{2,j} - 6u_{1,j} v_{5,j} - 6u_{5,j} v_{1,j}.\end{aligned}$$

Lemma 5

$$\begin{aligned}\text{Var}(\hat{d}_{(6)}) &= \frac{400}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i^3 y_i^3 \right)^2 \right) + \frac{225}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^8 + \left(\sum_{i=1}^D x_i^2 y_i^4 \right)^2 \right) \\ &\quad + \frac{225}{k} \left(\sum_{i=1}^D x_i^8 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^4 y_i^2 \right)^2 \right) + \frac{36}{k} \left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^{10} + \left(\sum_{i=1}^D x_i y_i^5 \right)^2 \right) \\ &\quad + \frac{36}{k} \left(\sum_{i=1}^D x_i^{10} \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^5 y_i \right)^2 \right) + \Delta_6\end{aligned}$$

where

$$\begin{aligned}\Delta_6 &= -\frac{600}{k} \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^7 + \sum_{i=1}^D x_i^3 y_i^4 \sum_{i=1}^D x_i^2 y_i^3 \right) - \frac{600}{k} \left(\sum_{i=1}^D x_i^7 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i^3 y_i^2 \sum_{i=1}^D x_i^4 y_i^3 \right) \\ &\quad + \frac{240}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^8 + \sum_{i=1}^D x_i^3 y_i^5 \sum_{i=1}^D x_i y_i^3 \right) + \frac{240}{k} \left(\sum_{i=1}^D x_i^8 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i^3 y_i \sum_{i=1}^D x_i^5 y_i^3 \right) \\ &\quad + \frac{450}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \sum_{i=1}^D x_i^2 y_i^2 \sum_{i=1}^D x_i^4 y_i^4 \right) - \frac{180}{k} \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^9 + \sum_{i=1}^D x_i^2 y_i^5 \sum_{i=1}^D x_i y_i^4 \right) \\ &\quad - \frac{180}{k} \left(\sum_{i=1}^D x_i^7 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^5 y_i^4 \right) - \frac{180}{k} \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^7 + \sum_{i=1}^D x_i^4 y_i^5 \sum_{i=1}^D x_i y_i^2 \right) \\ &\quad - \frac{180}{k} \left(\sum_{i=1}^D x_i^9 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^4 y_i \sum_{i=1}^D x_i^5 y_i^2 \right) + \frac{72}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^5 y_i^5 \right).\end{aligned}$$

Proof 5 See Appendix C. $\square$.

When all entries of x and y are non-negative, we believe it is true that $\Delta_6 \leq 0$, but we did not proceed with the proof.

Of course, it is again a good idea to take advantage of the marginal norms, but we skip the analysis.

4 Sub-Gaussian Random Projections

It is well-known that it is not necessary to sample $r_{ij} \sim N(0, 1)$. In fact, to have an unbiased estimator, it suffices to sample r_{ij} from any distribution with zero mean (and

unit variance). For good higher-order behaviors, it is often a good idea to sample from a *sub-Gaussian* distribution, of which a zero-mean normal distribution is a special case.

The theory of *sub-Gaussian* distributions was developed in the 1950's. See [6] and references therein. A random variable x is *sub-Gaussian* if there exists a constant $g > 0$ such that for all $t \in \mathbb{R}$:

$$\mathbb{E}(\exp(xt)) \leq \exp\left(\frac{g^2 t^2}{2}\right).$$

In this section, we sample r_{ij} from a sub-Gaussian distribution with the following restrictions:

$$\mathbb{E}(r_{ij}) = 0, \quad \mathbb{E}(r_{ij}^2) = 1, \quad \mathbb{E}(r_{ij}^4) = s,$$

and we denote $r_{ij} \sim \text{SubG}(s)$. It can be shown that we must restrict $s \geq 1$.

One example would be the $r_{ij} \sim \text{Uniform}(-\sqrt{3}, \sqrt{3})$, for which $s = \frac{9}{5}$. Although the uniform distribution is simpler than normal, it is now well-known that we should sample from the following three-point sub-Gaussian distributions[1].

$$r_{ij} = \sqrt{s} \times \begin{cases} 1 & \text{with prob. } \frac{1}{2s} \\ 0 & \text{with prob. } 1 - \frac{1}{s} \\ -1 & \text{with prob. } \frac{1}{2s} \end{cases}, \quad s \geq 1$$

In our analysis, we do not have to specify the exact distribution of r_{ij} and we can simply express the estimation variance as a function of s .

Here, we consider the basic projections strategy, by generating one random projection matrix $\mathbf{R} \in \mathbb{R}^{n \times D}$ with i.i.d. entries $r_{ij} \sim \text{SubG}(s)$, and

$$\begin{aligned} u_{1,j} &= \sum_{i=1}^D x_i r_{ij}, u_{2,j} = \sum_{i=1}^D x_i^2 r_{ij}, u_{3,j} = \sum_{i=1}^D x_i^3 r_{ij}, \\ v_{1,j} &= \sum_{i=1}^D y_i r_{ij}, v_{2,j} = \sum_{i=1}^D y_i^2 r_{ij}, v_{3,j} = \sum_{i=1}^D y_i^3 r_{ij}. \end{aligned}$$

We again have a simple unbiased estimator of $d_{(4)}$

$$\hat{d}_{(4),s} = \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} (6u_2^T v_2 - 4u_3^T v_1 - 4u_1^T v_3)$$

Lemma 6

$$\begin{aligned}
\text{Var}(\hat{d}_{(4),s}) = & \frac{36}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 + (s-3) \sum_{i=1}^D x_i^4 y_i^4 \right) \\
& + \frac{16}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^3 y_i \right)^2 + (s-3) \sum_{i=1}^D x_i^6 y_i^2 \right) \\
& + \frac{16}{k} \left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i y_i^3 \right)^2 + (s-3) \sum_{i=1}^D x_i^2 y_i^6 \right) \\
& - \frac{48}{k} \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 + (s-3) \sum_{i=1}^D x_i^5 y_i^3 \right) \\
& - \frac{48}{k} \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 + (s-3) \sum_{i=1}^D x_i^3 y_i^5 \right) \\
& + \frac{32}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 + (s-3) \sum_{i=1}^D x_i^4 y_i^4 \right).
\end{aligned}$$

Proof 6 See Appendix D. $\square$.

5 Conclusions

It has been an active research topic on approximating l_p distances in massive high-dimensional data, for example, a giant “data matrix” $\mathbf{A} \in \mathbb{R}^{n \times D}$. While a linear scan on $\mathbf{A}$ may be feasible, it can be prohibitive (or even infeasible) to compute and store all pairwise l_p distances. Using random projections can reduce the cost of computing all pairwise distances from $O(n^2 D)$ to $(n^2 k)$ where $k \ll D$. The data size is reduced from $O(nD)$ to $O(nk)$ and hence it may be possible to store the reduced data in memory.

While the well-known method of *stable random projections* is applicable to $0 < p \leq 2$, not directly to $p > 2$, we propose a practical approach for approximating the l_p distances in massive data for $p = 2, 4, 6, \dots$, based on the simple fact that, when p is even, the l_p distances can be decomposed into 2 marginal norms and $p - 1$ “inner products” of various orders. Two projection strategies are proposed to approximate these “inner products” as well as the l_p distances; and we show the basic projection strategy (which is simpler) is always preferable over the alternative strategy in terms of the accuracy, at least for $p = 4$ in non-negative data. We also propose utilizing the marginal norms (which can be easily computed exactly) to further improve the estimates. Finally, we analyze the performance using sub-Gaussian random projections.

A Proof of Lemma 1

$$\begin{aligned}
\hat{d}_{(4)} &= \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} \left(6u_2^\top v_2 - 4u_3^\top v_1 - 4u_1^\top v_3 \right) \\
&= \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} \left(\sum_{j=1}^k 6u_{2,j}v_{2,j} - 4u_{3,j}v_{1,j} - 4u_{1,j}v_{3,j} \right) \\
u_{2,j}v_{2,j} &= \left(\sum_{i=1}^D x_i^2 r_{ij} \right) \left(\sum_{i=1}^D y_i^2 r_{ij} \right) = \sum_{i=1}^D x_i^2 y_i^2 r_{ij}^2 + \sum_{i \neq i'} x_i^2 r_{ij} y_{i'}^2 r_{i'j}
\end{aligned}$$

Thus

$$\mathbb{E}(u_{2,j}v_{2,j}) = \sum_{i=1}^D x_i^2 y_i^2.$$

Similarly, we can show

$$\mathbb{E}(u_{3,j}v_{1,j}) = \sum_{i=1}^D x_i^3 y_i, \quad \mathbb{E}(u_{1,j}v_{3,j}) = \sum_{i=1}^D x_i y_i^3.$$

Therefore,

$$\begin{aligned}
\mathbb{E}(\hat{d}_{(4)}) &= \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} \left(\sum_{j=1}^k \mathbb{E}(6u_{2,j}v_{2,j} - 4u_{3,j}v_{1,j} - 4u_{1,j}v_{3,j}) \right) \\
&= \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} \left(\sum_{j=1}^k \left(6 \sum_{i=1}^D x_i^2 y_i^2 - 4 \sum_{i=1}^D x_i^3 y_i - 4 \sum_{i=1}^D x_i y_i^3 \right) \right) = d_{(4)}.
\end{aligned}$$

To derive the variance, we need to analyze the expectation

$$\begin{aligned}
&(6u_{2,j}v_{2,j} - 4u_{3,j}v_{1,j} - 4u_{1,j}v_{3,j})^2 \\
&= 36u_{2,j}^2 v_{2,j}^2 + 16u_{3,j}^2 v_{1,j}^2 + 16u_{1,j}^2 v_{3,j}^2 - 48u_{2,j}u_{3,j}v_{2,j}v_{1,j} \\
&\quad - 48u_{2,j}u_{1,j}v_{2,j}v_{3,j} + 32u_{3,j}u_{1,j}v_{1,j}v_{3,j}.
\end{aligned}$$

To simplify the expression, we will skip the terms that will be zeros when taking expectations.

$$\begin{aligned}
\mathbb{E}(u_{2,j}^2 v_{2,j}^2) &= \mathbb{E} \left(\left(\sum_{i=1}^D x_i^2 y_i^2 r_{ij}^2 + \sum_{i \neq i'} x_i^2 r_{ij} y_{i'}^2 r_{i'j} \right)^2 \right) \\
&= \mathbb{E} \left(\sum_{i=1}^D x_i^4 y_i^4 r_{ij}^4 + 2 \sum_{i \neq i'} x_i^2 y_i^2 r_{ij}^2 x_{i'}^2 y_{i'}^2 r_{i'j}^2 + \sum_{i \neq i'} x_i^4 r_{ij}^2 y_{i'}^4 r_{i'j}^2 \right) \\
&= \sum_{i=1}^D 3x_i^4 y_i^4 + 2 \sum_{i \neq i'} x_i^2 y_i^2 x_{i'}^2 y_{i'}^2 + \sum_{i \neq i'} x_i^4 y_{i'}^4 \\
&= \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + 2 \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2.
\end{aligned}$$

Similarly

$$\begin{aligned} \mathbb{E}(u_{3,j}^2 v_{1,j}^2) &= \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + 2 \left(\sum_{i=1}^D x_i^3 y_i \right)^2, \\ \mathbb{E}(u_{3,j}^2 v_{1,j}^2) &= \sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + 2 \left(\sum_{i=1}^D x_i y_i^3 \right)^2. \end{aligned}$$

$$\begin{aligned} &\mathbb{E}(u_{2,j} u_{3,j} v_{2,j} v_{1,j}) \\ &= \mathbb{E} \left(\sum_{i=1}^D x_i^2 r_{ij} \sum_{i=1}^D x_i^3 r_{ij} \sum_{i=1}^D y_i^2 r_{ij} \sum_{i=1}^D y_i r_{ij} \right) \\ &= \mathbb{E} \left(\left(\sum_{i=1}^D x_i^5 r_{ij}^2 + \sum_{i \neq i'} x_i^2 r_{ij} x_{i'}^3 r_{i'j} \right) \left(\sum_{i=1}^D y_i^3 r_{ij}^2 + \sum_{i \neq i'} y_i^2 r_{ij} y_{i'} r_{i'j} \right) \right) \\ &= \mathbb{E} \left(\sum_{i=1}^D x_i^5 y_i^3 r_{ij}^4 + \sum_{i \neq i'} x_i^5 r_{ij}^2 y_{i'}^3 r_{i'j}^2 \right) \\ &\quad + \mathbb{E} \left(\sum_{i \neq i'} x_i^2 y_i^2 r_{ij}^2 x_{i'}^3 y_{i'} r_{i'j}^2 + \sum_{i \neq i'} x_i^2 y_i r_{ij}^2 x_{i'}^3 y_{i'}^2 r_{i'j}^2 \right) \\ &= 3 \sum_{i=1}^D x_i^5 y_i^3 + \sum_{i \neq i'} x_i^5 y_{i'}^3 + \sum_{i \neq i'} x_i^2 y_i^2 x_{i'}^3 y_{i'} + \sum_{i \neq i'} x_i^2 y_i x_{i'}^3 y_{i'}^2 \\ &= \sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i^2 \sum_{i=1}^D x_i^3 y_i + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2. \end{aligned}$$

Similarly

$$\begin{aligned} &\mathbb{E}(u_{2,j} u_{1,j} v_{2,j} v_{3,j}) \\ &= \sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^2 y_i^2 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3, \\ &\mathbb{E}(u_{3,j} u_{1,j} v_{1,j} v_{3,j}) \\ &= \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^3 y_i + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3. \end{aligned}$$

Therefore,

$$\begin{aligned}
& \text{Var}(6u_{2,j}v_{2,j} - 4u_{3,j}v_{1,j} - 4u_{1,j}v_{3,j}) \\
&= 36 \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + 72 \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 \\
&+ 16 \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + 32 \left(\sum_{i=1}^D x_i^3 y_i \right)^2 \\
&+ 16 \sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + 32 \left(\sum_{i=1}^D x_i y_i^3 \right)^2 \\
&- 48 \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i^2 \sum_{i=1}^D x_i^3 y_i + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 \right) \\
&- 48 \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^2 y_i^2 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 \right) \\
&+ 32 \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^3 y_i + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 \right) \\
&- \left(6 \sum_{i=1}^D x_i^2 y_i^2 - 4 \sum_{i=1}^D x_i^3 y_i - 4 \sum_{i=1}^D x_i y_i^3 \right)^2
\end{aligned}$$

from which it follows that

$$\begin{aligned}
\text{Var}(\hat{d}_{(4)}) &= \frac{36}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 \right) \\
&+ \frac{16}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^3 y_i \right)^2 \right) \\
&+ \frac{16}{k} \left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i y_i^3 \right)^2 \right) \\
&- \frac{48}{k} \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 \right) \\
&- \frac{48}{k} \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 \right) \\
&+ \frac{32}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 \right)
\end{aligned}$$

B Proof of Lemma 3

It suffices to show that

$$\begin{aligned} & \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 \right) \\ & + \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 \right) \\ & - \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 \right) \geq 0. \end{aligned}$$

We need to use the arithmetic-geometric mean inequality:

$$\sum_{i=1}^n w_i \geq n \left(\prod_{i=1}^n w_i \right)^{1/n}, \quad \text{provided } w_i \geq 0.$$

Because

$$x_i^5 y_j^3 + x_i^3 y_j^5 \geq 2 \sqrt{x_i^8 y_j^8} = 2 x_i^4 y_j^4,$$

$$\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 - \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 \geq 0.$$

Thus it only remains to show that

$$\sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 - \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 \geq 0,$$

for which it suffices to show that

$$2 \sum_{i=1}^D x_i^{3/2} y_i^{3/2} \sum_{i=1}^D x_i^{5/2} y_i^{5/2} - \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 \geq 0,$$

or equivalently, to show that, if $z_i \geq 0 \forall i \in [1, D]$, then

$$f(z_i, i = 1, 2, \dots, D) = 2 \sum_{i=1}^D z_i^3 \sum_{i=1}^D z_i^5 - \sum_{i=1}^D z_i^2 \sum_{i=1}^D z_i^6 \geq 0. \quad (3)$$

Obviously, (3) holds for $D = 1$ and $D = 2$. To see that it is true for $D > 2$, we notice that only at $(z_1 = 0, z_2 = 0, \dots, z_D = 0)$, the first derivative of $f(z_i)$ is zero. We can also check that $f(z_i = 1, i = 1, 2, \dots, D) > 0$. Since $f(z_i)$ is a continuous function, we know $f(z_i) \geq 0$ must hold if $z_i > 0$ for all i . There is no need to worry about the boundary case that $z_j = 0$ and $z_i \geq 0$ because it is reduced to a small problem with $D' = D - 1$ and we have already shown the base case when $D = 1$ and $D = 2$. Thus, we complete the proof.

C Proof of Lemma 5

$$d_{(6)} = \sum_{i=1}^D x_i^6 + \sum_{i=1}^D y_i^6 - 20 \sum_{i=1}^D x_i^3 y_i^3 \\ + 15 \sum_{i=1}^D x_i^2 y_i^4 + 15 \sum_{i=1}^D x_i^4 y_i^2 - 6 \sum_{i=1}^D x_i^5 y_i - 6 \sum_{i=1}^D x_i y_i^5$$

$$\hat{d}_{(6)} = \sum_{i=1}^D x_i^6 + \sum_{i=1}^D y_i^6 + \frac{1}{k} \left(-20u_3^T v_3 + 15u_4^T v_2 + 15u_2^T v_4 - 6u_5^T v_3 - 6u_1^T v_5 \right) \\ = \sum_{i=1}^D x_i^6 + \sum_{i=1}^D y_i^6 + \frac{1}{k} \sum_{j=1}^k -20u_{3,j} v_{3,j} + 15u_{2,j} v_{4,j} + 15u_{4,j} v_{2,j} - 6u_{1,j} v_{5,j} - 6u_{5,j} v_{1,j}.$$

To derive the variance, we need to analyze the expectation of

$$\begin{aligned} & (-20u_{3,j} v_{3,j} + 15u_{2,j} v_{4,j} + 15u_{4,j} v_{2,j} - 6u_{1,j} v_{5,j} - 6u_{5,j} v_{1,j})^2 \\ &= 400u_{3,j}^2 v_{3,j}^2 + 225u_{2,j}^2 v_{4,j}^2 + 225u_{4,j}^2 v_{2,j}^2 + 36u_{1,j}^2 v_{5,j}^2 + 36u_{5,j}^2 v_{1,j}^2 \\ & - 600u_{3,j} v_{3,j} u_{2,j} v_{4,j} - 600u_{3,j} v_{3,j} u_{4,j} v_{2,j} + 240u_{3,j} v_{3,j} u_{1,j} v_{5,j} \\ & + 240u_{3,j} v_{3,j} u_{5,j} v_{1,j} + 450u_{2,j} v_{4,j} u_{4,j} v_{2,j} - 180u_{2,j} v_{4,j} u_{1,j} v_{5,j} \\ & - 180u_{2,j} v_{4,j} u_{5,j} v_{1,j} - 180u_{4,j} v_{2,j} u_{1,j} v_{5,j} - 180u_{4,j} v_{2,j} u_{5,j} v_{1,j} \\ & + 72u_{1,j} v_{5,j} u_{5,j} v_{1,j} \end{aligned}$$

Skipping the detail, we can show that

$$\begin{aligned} \mathbb{E}(u_{3,j}^2 v_{3,j}^2) &= \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + 2 \left(\sum_{i=1}^D x_i^3 y_i^3 \right)^2, \\ \mathbb{E}(u_{2,j}^2 v_{4,j}^2) &= \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^8 + 2 \left(\sum_{i=1}^D x_i^2 y_i^4 \right)^2, \\ \mathbb{E}(u_{4,j}^2 v_{2,j}^2) &= \sum_{i=1}^D x_i^8 \sum_{i=1}^D y_i^4 + 2 \left(\sum_{i=1}^D x_i^4 y_i^2 \right)^2, \\ \mathbb{E}(u_{1,j}^2 v_{5,j}^2) &= \sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^{10} + 2 \left(\sum_{i=1}^D x_i y_i^5 \right)^2, \\ \mathbb{E}(u_{5,j}^2 v_{1,j}^2) &= \sum_{i=1}^D x_i^{10} \sum_{i=1}^D y_i^2 + 2 \left(\sum_{i=1}^D x_i^5 y_i \right)^2. \end{aligned}$$

And

$$\begin{aligned}
& \mathbb{E}(u_{3,j}u_{2,j}v_{3,j}v_{4,j}) \\
&= \sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^7 + \sum_{i=1}^D x_i^3 y_i^3 \sum_{i=1}^D x_i^2 y_i^4 + \sum_{i=1}^D x_i^3 y_i^4 \sum_{i=1}^D x_i^2 y_i^3, \\
& \mathbb{E}(u_{3,j}u_{4,j}v_{3,j}v_{2,j}) \\
&= \sum_{i=1}^D x_i^7 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i^3 y_i^3 \sum_{i=1}^D x_i^4 y_i^2 + \sum_{i=1}^D x_i^3 y_i^2 \sum_{i=1}^D x_i^4 y_i^3, \\
& \mathbb{E}(u_{3,j}u_{1,j}v_{3,j}v_{5,j}) \\
&= \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^8 + \sum_{i=1}^D x_i^3 y_i^3 \sum_{i=1}^D x_i y_i^5 + \sum_{i=1}^D x_i^3 y_i^5 \sum_{i=1}^D x_i y_i^3, \\
& \mathbb{E}(u_{3,j}u_{5,j}v_{3,j}v_{1,j}) \\
&= \sum_{i=1}^D x_i^8 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i^3 y_i^3 \sum_{i=1}^D x_i^5 y_i^1 + \sum_{i=1}^D x_i^3 y_i^1 \sum_{i=1}^D x_i^5 y_i^3, \\
& \mathbb{E}(u_{2,j}u_{4,j}v_{4,j}v_{2,j}) \\
&= \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \sum_{i=1}^D x_i^2 y_i^4 \sum_{i=1}^D x_i^4 y_i^2 + \sum_{i=1}^D x_i^2 y_i^2 \sum_{i=1}^D x_i^4 y_i^4, \\
& \mathbb{E}(u_{2,j}u_{1,j}v_{4,j}v_{5,j}) \\
&= \sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^9 + \sum_{i=1}^D x_i^2 y_i^4 \sum_{i=1}^D x_i y_i^5 + \sum_{i=1}^D x_i^2 y_i^5 \sum_{i=1}^D x_i y_i^4, \\
& \mathbb{E}(u_{2,j}u_{5,j}v_{4,j}v_{1,j}) \\
&= \sum_{i=1}^D x_i^7 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i^2 y_i^4 \sum_{i=1}^D x_i^5 y_i + \sum_{i=1}^D x_i^2 y_i^5 \sum_{i=1}^D x_i^5 y_i^4, \\
& \mathbb{E}(u_{4,j}u_{1,j}v_{2,j}v_{5,j}) \\
&= \sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^7 + \sum_{i=1}^D x_i^4 y_i^2 \sum_{i=1}^D x_i y_i^5 + \sum_{i=1}^D x_i^4 y_i^5 \sum_{i=1}^D x_i y_i^2, \\
& \mathbb{E}(u_{4,j}u_{5,j}v_{2,j}v_{1,j}) \\
&= \sum_{i=1}^D x_i^9 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^4 y_i^2 \sum_{i=1}^D x_i^5 y_i + \sum_{i=1}^D x_i^4 y_i^5 \sum_{i=1}^D x_i^5 y_i^2, \\
& \mathbb{E}(u_{1,j}u_{5,j}v_{5,j}v_{1,j}) \\
&= \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \sum_{i=1}^D x_i y_i^5 \sum_{i=1}^D x_i^5 y_i + \sum_{i=1}^D x_i y_i^5 \sum_{i=1}^D x_i^5 y_i^5,
\end{aligned}$$

Combining the results, we obtain

$$\begin{aligned}
\text{Var}(\hat{d}_{(6)}) &= \frac{400}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i^3 y_i^3 \right)^2 \right) \\
&+ \frac{225}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^8 + \left(\sum_{i=1}^D x_i^2 y_i^4 \right)^2 \right) \\
&+ \frac{225}{k} \left(\sum_{i=1}^D x_i^8 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^4 y_i^2 \right)^2 \right) \\
&+ \frac{36}{k} \left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^{10} + \left(\sum_{i=1}^D x_i y_i^5 \right)^2 \right) \\
&+ \frac{36}{k} \left(\sum_{i=1}^D x_i^{10} \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^5 y_i \right)^2 \right) + \Delta_6
\end{aligned}$$

where

$$\begin{aligned}
k\Delta_6/6 &= -100 \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^7 + \sum_{i=1}^D x_i^3 y_i^4 \sum_{i=1}^D x_i^2 y_i^3 \right) \\
&- 100 \left(\sum_{i=1}^D x_i^7 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i^3 y_i^2 \sum_{i=1}^D x_i^4 y_i^3 \right) \\
&+ 40 \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^8 + \sum_{i=1}^D x_i^3 y_i^5 \sum_{i=1}^D x_i y_i^3 \right) \\
&+ 40 \left(\sum_{i=1}^D x_i^8 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i^3 y_i \sum_{i=1}^D x_i^5 y_i^3 \right) \\
&+ 75 \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \sum_{i=1}^D x_i^2 y_i^2 \sum_{i=1}^D x_i^4 y_i^4 \right) \\
&- 30 \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^9 + \sum_{i=1}^D x_i^2 y_i^5 \sum_{i=1}^D x_i y_i^4 \right) \\
&- 30 \left(\sum_{i=1}^D x_i^7 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^5 y_i^4 \right) \\
&- 30 \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^7 + \sum_{i=1}^D x_i^4 y_i^5 \sum_{i=1}^D x_i y_i^2 \right) \\
&- 30 \left(\sum_{i=1}^D x_i^9 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^4 y_i \sum_{i=1}^D x_i^5 y_i^2 \right) \\
&+ 12 \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^5 y_i^5 \right).
\end{aligned}$$

D Proof of Lemma 6

$$\begin{aligned}\hat{d}_{(4),s} &= \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} \left(6u_2^\top v_2 - 4u_3^\top v_1 - 4u_1^\top v_3 \right) \\ &= \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} \left(\sum_{j=1}^k 6u_{2,j}v_{2,j} - 4u_{3,j}v_{1,j} - 4u_{1,j}v_{3,j} \right)\end{aligned}$$

$$\begin{aligned}\mathbb{E}(u_{2,j}^2 v_{2,j}^2) &= \mathbb{E} \left(\left(\sum_{i=1}^D x_i^2 y_i^2 r_{ij}^2 + \sum_{i \neq i'} x_i^2 r_{ij} y_{i'}^2 r_{i'j}^2 \right)^2 \right) \\ &= \mathbb{E} \left(\sum_{i=1}^D x_i^4 y_i^4 r_{ij}^4 + 2 \sum_{i \neq i'} x_i^2 y_i^2 r_{ij}^2 x_{i'}^2 y_{i'}^2 r_{i'j}^2 + \sum_{i \neq i'} x_i^4 r_{ij}^2 y_{i'}^4 r_{i'j}^2 \right) \\ &= \sum_{i=1}^D s x_i^4 y_i^4 + 2 \sum_{i \neq i'} x_i^2 y_i^2 x_{i'}^2 y_{i'}^2 + \sum_{i \neq i'} x_i^4 y_{i'}^4 \\ &= \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + 2 \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 + (s-3) \sum_{i=1}^D x_i^4 y_i^4.\end{aligned}$$

Similarly,

$$\begin{aligned}\mathbb{E}(u_{3,j}^2 v_{1,j}^2) &= \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + 2 \left(\sum_{i=1}^D x_i^3 y_i \right)^2 + (s-3) \sum_{i=1}^D x_i^6 y_i^2, \\ \mathbb{E}(u_{3,j}^2 v_{1,j}^2) &= \sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + 2 \left(\sum_{i=1}^D x_i y_i^3 \right)^2 + (s-3) \sum_{i=1}^D x_i^2 y_i^6.\end{aligned}$$

$$\begin{aligned}\mathbb{E}(u_{2,j} u_{3,j} v_{2,j} v_{1,j}) &= \sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i^2 \sum_{i=1}^D x_i^3 y_i \\ &\quad + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 + (s-3) \sum_{i=1}^D x_i^5 y_i^3, \\ \mathbb{E}(u_{2,j} u_{1,j} v_{2,j} v_{3,j}) &= \sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^2 y_i^2 \\ &\quad + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 + (s-3) \sum_{i=1}^D x_i^3 y_i^5, \\ \mathbb{E}(u_{3,j} u_{1,j} v_{1,j} v_{3,j}) &= \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^3 y_i \\ &\quad + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 + (s-3) \sum_{i=1}^D x_i^4 y_i^4.\end{aligned}$$

Therefore,

$$\begin{aligned}
& \text{Var}(6u_{2,j}v_{2,j} - 4u_{3,j}v_{1,j} - 4u_{1,j}v_{3,j}) \\
&= 36 \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + 72 \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 + 36(s-3) \sum_{i=1}^D x_i^4 y_i^4 \\
&+ 16 \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + 32 \left(\sum_{i=1}^D x_i^3 y_i \right)^2 + 36(s-3) \sum_{i=1}^D x_i^6 y_i^2 \\
&+ 16 \sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + 32 \left(\sum_{i=1}^D x_i y_i^3 \right)^2 + 36(s-3) \sum_{i=1}^D x_i^2 y_i^6 \\
&- 48 \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i^2 \sum_{i=1}^D x_i^3 y_i + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 + (s-3) \sum_{i=1}^D x_i^5 y_i^3 \right) \\
&- 48 \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^2 y_i^2 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 + (s-3) \sum_{i=1}^D x_i^3 y_i^5 \right) \\
&+ 32 \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^3 y_i + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 + (s-3) \sum_{i=1}^D x_i^4 y_i^4 \right) \\
&- \left(6 \sum_{i=1}^D x_i^2 y_i^2 - 4 \sum_{i=1}^D x_i^3 y_i - 4 \sum_{i=1}^D x_i y_i^3 \right)^2
\end{aligned}$$

from which it follows that

$$\begin{aligned}
\text{Var}(\hat{d}_{(4),s}) &= \frac{36}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 + (s-3) \sum_{i=1}^D x_i^4 y_i^4 \right) \\
&+ \frac{16}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^3 y_i \right)^2 + (s-3) \sum_{i=1}^D x_i^6 y_i^2 \right) \\
&+ \frac{16}{k} \left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i y_i^3 \right)^2 + (s-3) \sum_{i=1}^D x_i^2 y_i^6 \right) \\
&- \frac{48}{k} \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 + (s-3) \sum_{i=1}^D x_i^5 y_i^3 \right) \\
&- \frac{48}{k} \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 + (s-3) \sum_{i=1}^D x_i^3 y_i^5 \right) \\
&+ \frac{32}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 + (s-3) \sum_{i=1}^D x_i^4 y_i^4 \right)
\end{aligned}$$

On Approximating the l_p Distances for $p > 2$ (When p Is Even)

Abstract

Many¹ applications in machine learning and data mining require computing pairwise l_p distances in a data matrix $\mathbf{A} \in \mathbb{R}^{n \times D}$. For massive high-dimensional data, computing all pairwise distances of $\mathbf{A}$ can be infeasible. In fact, even storing $\mathbf{A}$ or all pairwise distances of $\mathbf{A}$ in the memory may be also infeasible.

For $0 < p \leq 2$, efficient small space algorithms exist, for example, based on the method of *stable random projections*, which unfortunately is not directly applicable to $p = 3, 4, 5, 6, \dots$. This paper proposes a simple method for $p = 2, 4, 6, \dots$. We first decompose the l_p (where p is even) distances into a sum of 2 marginal norms and $p - 1$ “inner products” at different orders. Then we apply normal or sub-Gaussian random projections to approximate the resultant “inner products,” assuming that the marginal norms can be computed exactly by a linear scan.

We propose two strategies for applying random projections. The basic projection strategy requires only one projection matrix but it is more difficult to analyze, while the alternative projection strategy requires $p - 1$ projection matrices but its theoretical analysis is much easier. In terms of the accuracy, at least for $p = 4$, the basic strategy is always more accurate than the alternative strategy if the data are non-negative, which is common in reality.

1 Introduction

This study proposes a simple method for efficiently computing the l_p distances in a massive data matrix $\mathbf{A} \in \mathbb{R}^{n \times D}$ for $p > 2$ (where p is even), using *random projections*[?].

While many previous work on random projections focused on approximating the l_2 distances (and inner products), the method of *symmetric stable random projections*[?, ?, ?, ?] is applicable to approximating the l_p distances for all $0 < p \leq 2$. This work proposes using random projections for $p > 2$, at least for some special cases.

¹First draft Dec. 2007. Slightly revised June 2008.

Machine learning algorithms often operate on the l_p distances of $\mathbf{A}$ instead of the original data. A straightforward application would be searching for the nearest neighbors using l_p distance. The l_p distance is also a basic loss functions for quality measure. The widely used “kernel trick,” (e.g., for support vector machines (SVM)), is often constructed on top of the l_p distances[?].²

Here we can treat p as a *tuning* parameter. It is common to take $p = 2$ (*Euclidian* distance), or $p = \infty$ (*infinity* distance), $p = 1$ (*Manhattan* distance), or $p = 0$ (*Hamming* distance); but in principle any p values are possible. In fact, if there is an efficient mechanism to compute the l_p distances, then it becomes affordable to tune learning algorithms for many values of p for the best performance.

In modern data mining and learning applications, the ubiquitous phenomenon of “massive data” imposes challenges. For example, pre-computing and storing all pairwise l_p distances in memory at the cost $O(n^2)$ can be infeasible when $n > 10^6$ (or even just 10^5)[?]. For ultra high-dimensional data, even just storing the whole data matrix can be infeasible. In the meanwhile, modern applications can routinely involve millions of observations; and developing scalable learning and data mining algorithms has been an active research direction. One commonly used strategy in current practice is to compute the distances **on the fly**[], in stead of storing all pairwise l_p distances.

Data reduction algorithms such as sampling or sketching methods are also popular. While there have been extensive studies on approximating the l_p distances for $0 < p \leq 2$, $p > 2$ can be useful too. For example, because the normal distribution is completely determined by its first two moments (mean and variance), we can identify the non-normal components of the data by analyzing higher moments, in particular, the fourth moments (i.e., *kurtosis*). Thus, the fourth moments are critical, for example, in the field of *Independent Component Analysis (ICA)*[],. Therefore, it is viable to use the l_p distance for $p > 2$ when lower order distances can not efficiently differentiate data.

It is unfortunate that the family of *stable distributions*[] is limited to $0 < p \leq 2$ and hence we can not directly using *stable distributions* for approximating the l_p distances. In the theoretical CS community, there have been many studies on approximating the l_p norms and distances[?, ?, ?, ?, ?, ?, ?, ?, ?, ?], some of which also applicable to the l_p distances (e.g., comparing two long vectors). Those papers proved that small space ($\tilde{O}(1)$) algorithms exist only for $0 < p \leq 2$.

1.1 The Methodology

Given a giant data matrix $\mathbf{A} \in \mathbb{R}^{n \times D}$, we assume that a linear scan of the data is feasible, but computing all pairwise interactions is not, either due to computational budget constraints or memory limits. Also, we only consider even $p = 4, 6, \dots$, among which $p = 4$ is probably the most important.

Interestingly, our method is based only on normal (or normal-like) projections. The observation is that, when p is even, the l_p distance can be decomposed into marginal

²It is well-known that the radial basis kernel using the l_p distance with $0 < p \leq 2$ satisfies the Mercer’s condition. However, we can still use the l_p distance with $p > 2$ as kernels, although in this case it is not guaranteed to find the “most optimal” solution. For very large-scale learning, we usually will not find the “most optimal” solution any way.

l_p norms and “inner products” of various orders. For example, for two D -dimensional vectors x and y , when $p = 4$, then

$$d_{(p)} = \sum_{i=1}^D |x_i - y_i|^p = \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + 6 \sum_{i=1}^D x_i^2 y_i^2 - 4 \sum_{i=1}^D x_i^3 y_i - 4 \sum_{i=1}^D x_i y_i^3.$$

Since we assume that a linear scan of the data is feasible, we can compute $\sum_{i=1}^D x_i^4$ and $\sum_{i=1}^D y_i^4$ exactly. We can approximate the interaction terms $\sum_{i=1}^D x_i^2 y_i^2$, $\sum_{i=1}^D x_i^3 y_i$, and $\sum_{i=1}^D x_i y_i^3$ using normal (or normal-like) random projections. Therefore, for p being even, we are able to efficiently approximate the l_p distances.

1.2 Paper Organization

Section 2 concerns using normal random projections for approximating l_4 distances. We introduce two projection strategies and the concept of utilizing the marginal norms to improve the estimates. Section 3 extends this approach to approximating l_6 distances. Section 4 analyzes the effect of replacing normal projections by sub-Gaussian projections.

2 Normal Random Projections for $p = 4$

The goal is to efficiently compute all pairwise l_p ($p = 4$) distances in $\mathbf{A} \in \mathbb{R}^{n \times D}$. It suffices to consider any two rows of $\mathbf{A}$, say x and y , where $x, y \in \mathbb{R}^D$. We need to estimate the l_p distance between x and y

$$d_{(p)} = \sum_{i=1}^D |x_i - y_i|^p.$$

which, when $p = 4$, becomes

$$d_{(4)} = \sum_{i=1}^D |x_i - y_i|^4 = \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + 6 \sum_{i=1}^D x_i^2 y_i^2 - 4 \sum_{i=1}^D x_i^3 y_i - 4 \sum_{i=1}^D x_i y_i^3.$$

In one pass, we can compute $\sum_{i=1}^D x_i^4$ and $\sum_{i=1}^D y_i^4$ easily, but computing the interactions is more difficult. We resort to random projections for approximating $\sum_{i=1}^D x_i^2 y_i^2$, $\sum_{i=1}^D x_i^3 y_i$, and $\sum_{i=1}^D x_i y_i^3$. Since there are three “inner products” of different orders, we can choose either only one projection matrix for all three terms (the basic projection strategy), or three independent projection matrices (the alternative projection strategy).

2.1 The Basic Projection Strategy

First, generate a random matrix $\mathbf{R} \in \mathbb{R}^{D \times k}$ ($k \ll D$), with i.i.d. entries³ from a standard normal, i.e.,

$$\begin{aligned} r_{ij} &\sim N(0, 1), \quad \mathbb{E}(r_{ij}) = 0, \quad \mathbb{E}(r_{ij}^2) = 1, \quad \mathbb{E}(r_{ij}^4) = 3. \\ \mathbb{E}(r_{ij}^s r_{i'j'}^t) &= 0, \quad \text{if } t \text{ or } s \text{ is odd, and } i \neq i' \text{ or } j \neq j' \end{aligned}$$

Using random projections, we generate six vectors in k dimensions, $u_1, u_2, u_3, v_1, v_2, v_3 \in \mathbb{R}^k$:

$$\begin{aligned} u_{1,j} &= \sum_{i=1}^D x_i r_{ij}, \quad u_{2,j} = \sum_{i=1}^D x_i^2 r_{ij}, \quad u_{3,j} = \sum_{i=1}^D x_i^3 r_{ij}, \\ v_{1,j} &= \sum_{i=1}^D y_i r_{ij}, \quad v_{2,j} = \sum_{i=1}^D y_i^2 r_{ij}, \quad v_{3,j} = \sum_{i=1}^D y_i^3 r_{ij}. \end{aligned}$$

We have a simple unbiased estimator of $d_{(4)}$

$$\hat{d}_{(4)} = \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} (6u_2^\top v_2 - 4u_3^\top v_1 - 4u_1^\top v_3).$$

Lemma 1

$$\mathbb{E}(\hat{d}_{(4)}) = d_{(4)},$$

$$\begin{aligned} \text{Var}(\hat{d}_{(4)}) &= \frac{36}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 \right) \\ &\quad + \frac{16}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^3 y_i \right)^2 \right) \\ &\quad + \frac{16}{k} \left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i y_i^3 \right)^2 \right) + \Delta_4 \end{aligned}$$

$$\begin{aligned} \Delta_4 &= -\frac{48}{k} \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 \right) \\ &\quad - \frac{48}{k} \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 \right) \\ &\quad + \frac{32}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 \right). \end{aligned}$$

³It is possible to relax the requirement of i.i.d samples. In fact, to prove unbiasedness of the estimates only needs pairwise independence, and to derive the variance formula requires four-wise independence.

Proof 1 See Appendix A. $\square$

The basic projection strategy is simple but its analysis is quite involved, especially when $p > 4$. Also, if we are interested in higher order moments (other than variance) of the estimator, the analysis becomes very tedious.

2.2 The Alternative Projection Strategy

Instead of one projection matrix $\mathbf{R}$, we generate three, $\mathbf{R}^{(a)}$, $\mathbf{R}^{(b)}$, $\mathbf{R}^{(c)}$, independently. By random projections, we generate six vectors in k dimensions, $u_1, u_2, u_3, v_1, v_2, v_3 \in \mathbb{R}^k$, such that

$$\begin{aligned} u_{1,j} &= \sum_{i=1}^D x_i r_{ij}^{(c)}, \quad u_{2,j} = \sum_{i=1}^D x_i^2 r_{ij}^{(a)}, \quad u_{3,j} = \sum_{i=1}^D x_i^3 r_{ij}^{(b)}, \\ v_{1,j} &= \sum_{i=1}^D y_i r_{ij}^{(b)}, \quad v_{2,j} = \sum_{i=1}^D y_i^2 r_{ij}^{(a)}, \quad v_{3,j} = \sum_{i=1}^D y_i^3 r_{ij}^{(c)}. \end{aligned}$$

Here we abuse the notation slightly by using the same u and v for both projection strategies.

Again, we have an unbiased estimator, denoted by $\hat{d}_{(4),a}$

$$\hat{d}_{(4),a} = \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} (6u_2^T v_2 - 4u_3^T v_1 - 4u_1^T v_3)$$

Lemma 2

$$E(\hat{d}_{(4),a}) = d_{(4)},$$

$$\begin{aligned} \text{Var}(\hat{d}_{(4),a}) &= \frac{36}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 \right) \\ &\quad + \frac{16}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^3 y_i \right)^2 \right) \\ &\quad + \frac{16}{k} \left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i y_i^3 \right)^2 \right). \end{aligned}$$

Proof 2 The proof basically follows from that of Lemma 1.

Compared with $\text{Var}(\hat{d}_{(4)})$ in Lemma 1, the difference would be Δ_4

$$\begin{aligned}
& \text{Var}(\hat{d}_{(4)}) - \text{Var}(\hat{d}_{(4),a}) = \Delta_4 \\
&= -\frac{48}{k} \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 \right) \\
&\quad - \frac{48}{k} \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 \right) \\
&\quad + \frac{32}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 \right), \tag{1}
\end{aligned}$$

which can be either negative or positive. For example, when all x_i 's are negative and all y_i 's are positive, then $\Delta_4 \geq 0$, i.e., the alternative projections strategy results in smaller variance and hence it should be adopted.

We can show in Lemma 3 that when the data are non-negative (which is more likely the reality), the difference in (1) will never exceed zero, suggesting that the basic strategy would be preferable, which is also operationally simpler (although more sophisticated in the analysis).

Lemma 3 *If all entries of x and y are non-negative, then*

$$\text{Var}(\hat{d}_{(4)}) - \text{Var}(\hat{d}_{(4),a}) = \Delta_4 \leq 0. \tag{2}$$

Proof 3 See Appendix B. $\square$.

Thus, the main advantage of the alternative projection strategy is that it simplifies the analysis, especially true when $p > 4$. Also, analyzing the alternative projection strategy may provide an estimate for the basic projection strategy. For example, the variance of $\hat{d}_{(4),a}$ is an upper bound of the variance of $\hat{d}_{(4)}$ in non-negative data.

In the next subsection, we show that the alternative strategy make the analysis feasible when we take advantage of the marginal information.

2.3 Improving the Estimates Using Margins

Since we assume that a linear scan of the data is feasible and in fact the estimators in both strategies already take advantage of the marginal l_4 norms, $\sum_{i=1}^D x_i^4$ and $\sum_{i=1}^D y_i^4$, we might as well compute other marginal norms and try to take advantage of them in a systematic manner.

Lemma 4 demonstrates such a method for improving estimates using margins. For simplicity, we assume in Lemma 4 that we adopt the alternative projection strategy, in order to carry out the (asymptotic) analysis of the variance.

Lemma 4 Suppose we use the alternative projection strategy described in Section 2.2 to generate samples $u_{1,j}$, $u_{2,j}$, $u_{3,j}$, $v_{1,j}$, $v_{2,j}$, and $v_{3,j}$. We estimate $d_{(4)}$ by

$$\hat{d}_{(4),a,mle} = \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + 6\hat{a}_{2,2} - 4\hat{a}_{3,1} - 4\hat{a}_{1,3},$$

where $\hat{a}_{2,2}$, $\hat{a}_{3,1}$, $\hat{a}_{1,3}$, are respectively, the solutions to the following three cubic equations:

$$\begin{aligned} a_{2,2}^3 - \frac{a_{2,2}^2}{k} u_2^T v_2 - \frac{1}{k} \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 u_2^T v_2 \\ + a_{2,2} \left(- \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 \right) + \frac{a_{2,2}}{k} \left(\sum_{i=1}^D x_i^4 \|v_2\|^2 + \sum_{i=1}^D y_i^4 \|u_2\|^2 \right) = 0. \end{aligned}$$

$$\begin{aligned} a_{3,1}^3 - \frac{a_{3,1}^2}{k} u_3^T v_1 - \frac{1}{k} \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 u_3^T v_1 \\ + a_{3,1} \left(- \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 \right) + \frac{a_{3,1}}{k} \left(\sum_{i=1}^D x_i^6 \|v_1\|^2 + \sum_{i=1}^D y_i^2 \|u_3\|^2 \right) = 0. \end{aligned}$$

$$\begin{aligned} a_{1,3}^3 - \frac{a_{1,3}^2}{k} u_1^T v_3 - \frac{1}{k} \sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 u_1^T v_3 \\ + a_{1,3} \left(- \sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 \right) + \frac{a_{1,3}}{k} \left(\sum_{i=1}^D x_i^2 \|v_3\|^2 + \sum_{i=1}^D y_i^6 \|u_1\|^2 \right) = 0. \end{aligned}$$

Asymptotically (as $k \rightarrow \infty$), the variance would be

$$\begin{aligned} & \text{Var} \left(\hat{d}_{(4),a,mle} \right) \\ &= 36 \text{Var}(\hat{a}_{2,2}) + 16 \text{Var}(\hat{a}_{2,2}) + 16 \text{Var}(\hat{a}_{2,2}) \\ &= \frac{36}{k} \frac{\left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 - \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 \right)^2}{\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2} \\ &+ \frac{16}{k} \frac{\left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 - \left(\sum_{i=1}^D x_i^3 y_i \right)^2 \right)^2}{\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^3 y_i \right)^2} \\ &+ \frac{16}{k} \frac{\left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 - \left(\sum_{i=1}^D x_i y_i^3 \right)^2 \right)^2}{\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i y_i^3 \right)^2} + O\left(\frac{1}{k^2}\right) \end{aligned}$$

Proof 4 [?, ?] proposed taking advantage of the marginal l_2 norms to improve the estimates of l_2 distances and inner products. Because we assume the alternative projection strategy, we can analyze $\hat{a}_{2,2}$, $\hat{a}_{3,1}$, and $\hat{a}_{1,3}$, independently and then combine the results; and hence we skip the detailed proof.

Of course, in practice, we probably still prefer the basic projection strategy, i.e., only one projection matrix instead of three. In this case, we still solve three cubic equations, but the precise analysis of the variance becomes much more difficult. When the data are non-negative, we believe that $\text{Var}(\hat{d}_{(4),a,mle})$ will also be the upper bound of the estimation variance using the basic projection strategy, which can be easily verified by empirical results (not included in the current report).

Solving cubic equations is easy, as there are closed-form solutions. We can also solve the equations by iterative methods. In fact, it is common practice to do only a one-step iteration (starting with the solution without using margins), called “one-step Newton-Rhapson” in statistics.

3 Normal Random Projections for P=6

For higher p (where p is even), we can follow basically the same procedure as for $p = 4$. To illustrate this, we work out an example for $p = 6$. We only demonstrate the basic projection strategy.

The l_6 distance can be decomposed into 2 marginal norms and 5 inner products at various orders:

$$\begin{aligned} d_{(6)} = & \sum_{i=1}^D x_i^6 + \sum_{i=1}^D y_i^6 - 20 \sum_{i=1}^D x_i^3 y_i^3 \\ & + 15 \sum_{i=1}^D x_i^2 y_i^4 + 15 \sum_{i=1}^D x_i^4 y_i^2 - 6 \sum_{i=1}^D x_i^5 y_i - 6 \sum_{i=1}^D x_i y_i^5 \end{aligned}$$

Generate one random projection matrix $\mathbf{R} \in \mathbb{R}^{D \times k}$, and

$$\begin{aligned} u_{1,j} &= \sum_{i=1}^D x_i r_{ij}, u_{2,j} = \sum_{i=1}^D x_i^2 r_{ij}, u_{3,j} = \sum_{i=1}^D x_i^3 r_{ij}, \\ u_{4,j} &= \sum_{i=1}^D x_i^4 r_{ij}, u_{5,j} = \sum_{i=1}^D x_i^5 r_{ij}, \\ v_{1,j} &= \sum_{i=1}^D y_i r_{ij}, v_{2,j} = \sum_{i=1}^D y_i^2 r_{ij}, v_{3,j} = \sum_{i=1}^D y_i^3 r_{ij}, \\ v_{4,j} &= \sum_{i=1}^D y_i^4 r_{ij}, v_{5,j} = \sum_{i=1}^D y_i^5 r_{ij}. \end{aligned}$$

Lemma 5 provide the variance of the following unbiased estimator of $d_{(6)}$:

$$\begin{aligned}\hat{d}_{(6)} &= \sum_{i=1}^D x_i^6 + \sum_{i=1}^D y_i^6 + \frac{1}{k} \left(-20u_3^T v_3 + 15u_4^T v_2 + 15u_2^T v_4 - 6u_5^T v_3 - 6u_1^T v_5 \right) \\ &= \sum_{i=1}^D x_i^6 + \sum_{i=1}^D y_i^6 + \frac{1}{k} \sum_{j=1}^k -20u_{3,j} v_{3,j} + 15u_{2,j} v_{4,j} + 15u_{4,j} v_{2,j} - 6u_{1,j} v_{5,j} - 6u_{5,j} v_{1,j}.\end{aligned}$$

Lemma 5

$$\begin{aligned}\text{Var}(\hat{d}_{(6)}) &= \frac{400}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i^3 y_i^3 \right)^2 \right) + \frac{225}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^8 + \left(\sum_{i=1}^D x_i^2 y_i^4 \right)^2 \right) \\ &\quad + \frac{225}{k} \left(\sum_{i=1}^D x_i^8 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^4 y_i^2 \right)^2 \right) + \frac{36}{k} \left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^{10} + \left(\sum_{i=1}^D x_i y_i^5 \right)^2 \right) \\ &\quad + \frac{36}{k} \left(\sum_{i=1}^D x_i^{10} \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^5 y_i \right)^2 \right) + \Delta_6\end{aligned}$$

where

$$\begin{aligned}\Delta_6 &= -\frac{600}{k} \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^7 + \sum_{i=1}^D x_i^3 y_i^4 \sum_{i=1}^D x_i^2 y_i^3 \right) - \frac{600}{k} \left(\sum_{i=1}^D x_i^7 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i^3 y_i^2 \sum_{i=1}^D x_i^4 y_i^3 \right) \\ &\quad + \frac{240}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^8 + \sum_{i=1}^D x_i^3 y_i^5 \sum_{i=1}^D x_i y_i^3 \right) + \frac{240}{k} \left(\sum_{i=1}^D x_i^8 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i^3 y_i \sum_{i=1}^D x_i^5 y_i^3 \right) \\ &\quad + \frac{450}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \sum_{i=1}^D x_i^2 y_i^2 \sum_{i=1}^D x_i^4 y_i^4 \right) - \frac{180}{k} \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^9 + \sum_{i=1}^D x_i^2 y_i^5 \sum_{i=1}^D x_i y_i^4 \right) \\ &\quad - \frac{180}{k} \left(\sum_{i=1}^D x_i^7 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^5 y_i^4 \right) - \frac{180}{k} \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^7 + \sum_{i=1}^D x_i^4 y_i^5 \sum_{i=1}^D x_i y_i^2 \right) \\ &\quad - \frac{180}{k} \left(\sum_{i=1}^D x_i^9 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^4 y_i \sum_{i=1}^D x_i^5 y_i^2 \right) + \frac{72}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^5 y_i^5 \right).\end{aligned}$$

Proof 5 See Appendix C. $\square$.

When all entries of x and y are non-negative, we believe it is true that $\Delta_6 \leq 0$, but we did not proceed with the proof.

Of course, it is again a good idea to take advantage of the marginal norms, but we skip the analysis.

4 Sub-Gaussian Random Projections

It is well-known that it is not necessary to sample $r_{ij} \sim N(0, 1)$. In fact, to have an unbiased estimator, it suffices to sample r_{ij} from any distribution with zero mean (and

unit variance). For good higher-order behaviors, it is often a good idea to sample from a *sub-Gaussian* distribution, of which a zero-mean normal distribution is a special case.

The theory of *sub-Gaussian* distributions was developed in the 1950's. See [?] and references therein. A random variable x is *sub-Gaussian* if there exists a constant $g > 0$ such that for all $t \in \mathbb{R}$:

$$\mathbb{E}(\exp(xt)) \leq \exp\left(\frac{g^2 t^2}{2}\right).$$

In this section, we sample r_{ij} from a sub-Gaussian distribution with the following restrictions:

$$\mathbb{E}(r_{ij}) = 0, \quad \mathbb{E}(r_{ij}^2) = 1, \quad \mathbb{E}(r_{ij}^4) = s,$$

and we denote $r_{ij} \sim \text{SubG}(s)$. It can be shown that we must restrict $s \geq 1$.

One example would be the $r_{ij} \sim \text{Uniform}(-\sqrt{3}, \sqrt{3})$, for which $s = \frac{9}{5}$. Although the uniform distribution is simpler than normal, it is now well-known that we should sample from the following three-point sub-Gaussian distributions[?].

$$r_{ij} = \sqrt{s} \times \begin{cases} 1 & \text{with prob. } \frac{1}{2s} \\ 0 & \text{with prob. } 1 - \frac{1}{s} \\ -1 & \text{with prob. } \frac{1}{2s} \end{cases}, \quad s \geq 1$$

In our analysis, we do not have to specify the exact distribution of r_{ij} and we can simply express the estimation variance as a function of s .

Here, we consider the basic projections strategy, by generating one random projection matrix $\mathbf{R} \in \mathbb{R}^{n \times D}$ with i.i.d. entries $r_{ij} \sim \text{SubG}(s)$, and

$$\begin{aligned} u_{1,j} &= \sum_{i=1}^D x_i r_{ij}, u_{2,j} = \sum_{i=1}^D x_i^2 r_{ij}, u_{3,j} = \sum_{i=1}^D x_i^3 r_{ij}, \\ v_{1,j} &= \sum_{i=1}^D y_i r_{ij}, v_{2,j} = \sum_{i=1}^D y_i^2 r_{ij}, v_{3,j} = \sum_{i=1}^D y_i^3 r_{ij}. \end{aligned}$$

We again have a simple unbiased estimator of $d_{(4)}$

$$\hat{d}_{(4),s} = \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} (6u_2^T v_2 - 4u_3^T v_1 - 4u_1^T v_3)$$

Lemma 6

$$\begin{aligned}
\text{Var}(\hat{d}_{(4),s}) = & \frac{36}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 + (s-3) \sum_{i=1}^D x_i^4 y_i^4 \right) \\
& + \frac{16}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^3 y_i \right)^2 + (s-3) \sum_{i=1}^D x_i^6 y_i^2 \right) \\
& + \frac{16}{k} \left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i y_i^3 \right)^2 + (s-3) \sum_{i=1}^D x_i^2 y_i^6 \right) \\
& - \frac{48}{k} \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 + (s-3) \sum_{i=1}^D x_i^5 y_i^3 \right) \\
& - \frac{48}{k} \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 + (s-3) \sum_{i=1}^D x_i^3 y_i^5 \right) \\
& + \frac{32}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 + (s-3) \sum_{i=1}^D x_i^4 y_i^4 \right).
\end{aligned}$$

Proof 6 See Appendix D. $\square$.

5 Conclusions

It has been an active research topic on approximating l_p distances in massive high-dimensional data, for example, a giant “data matrix” $\mathbf{A} \in \mathbb{R}^{n \times D}$. While a linear scan on $\mathbf{A}$ may be feasible, it can be prohibitive (or even infeasible) to compute and store all pairwise l_p distances. Using random projections can reduce the cost of computing all pairwise distances from $O(n^2 D)$ to $(n^2 k)$ where $k \ll D$. The data size is reduced from $O(nD)$ to $O(nk)$ and hence it may be possible to store the reduced data in memory.

While the well-known method of *stable random projections* is applicable to $0 < p \leq 2$, not directly to $p > 2$, we propose a practical approach for approximating the l_p distances in massive data for $p = 2, 4, 6, \dots$, based on the simple fact that, when p is even, the l_p distances can be decomposed into 2 marginal norms and $p - 1$ “inner products” of various orders. Two projection strategies are proposed to approximate these “inner products” as well as the l_p distances; and we show the basic projection strategy (which is simpler) is always preferable over the alternative strategy in terms of the accuracy, at least for $p = 4$ in non-negative data. We also propose utilizing the marginal norms (which can be easily computed exactly) to further improve the estimates. Finally, we analyze the performance using sub-Gaussian random projections.

A Proof of Lemma 1

$$\begin{aligned}
\hat{d}_{(4)} &= \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} \left(6u_2^\top v_2 - 4u_3^\top v_1 - 4u_1^\top v_3 \right) \\
&= \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} \left(\sum_{j=1}^k 6u_{2,j}v_{2,j} - 4u_{3,j}v_{1,j} - 4u_{1,j}v_{3,j} \right) \\
u_{2,j}v_{2,j} &= \left(\sum_{i=1}^D x_i^2 r_{ij} \right) \left(\sum_{i=1}^D y_i^2 r_{ij} \right) = \sum_{i=1}^D x_i^2 y_i^2 r_{ij}^2 + \sum_{i \neq i'} x_i^2 r_{ij} y_{i'}^2 r_{i'j}
\end{aligned}$$

Thus

$$\mathbb{E}(u_{2,j}v_{2,j}) = \sum_{i=1}^D x_i^2 y_i^2.$$

Similarly, we can show

$$\mathbb{E}(u_{3,j}v_{1,j}) = \sum_{i=1}^D x_i^3 y_i, \quad \mathbb{E}(u_{1,j}v_{3,j}) = \sum_{i=1}^D x_i y_i^3.$$

Therefore,

$$\begin{aligned}
\mathbb{E}(\hat{d}_{(4)}) &= \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} \left(\sum_{j=1}^k \mathbb{E}(6u_{2,j}v_{2,j} - 4u_{3,j}v_{1,j} - 4u_{1,j}v_{3,j}) \right) \\
&= \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} \left(\sum_{j=1}^k \left(6 \sum_{i=1}^D x_i^2 y_i^2 - 4 \sum_{i=1}^D x_i^3 y_i - 4 \sum_{i=1}^D x_i y_i^3 \right) \right) = d_{(4)}.
\end{aligned}$$

To derive the variance, we need to analyze the expectation

$$\begin{aligned}
&(6u_{2,j}v_{2,j} - 4u_{3,j}v_{1,j} - 4u_{1,j}v_{3,j})^2 \\
&= 36u_{2,j}^2 v_{2,j}^2 + 16u_{3,j}^2 v_{1,j}^2 + 16u_{1,j}^2 v_{3,j}^2 - 48u_{2,j}u_{3,j}v_{2,j}v_{1,j} \\
&\quad - 48u_{2,j}u_{1,j}v_{2,j}v_{3,j} + 32u_{3,j}u_{1,j}v_{1,j}v_{3,j}.
\end{aligned}$$

To simplify the expression, we will skip the terms that will be zeros when taking expectations.

$$\begin{aligned}
\mathbb{E}(u_{2,j}^2 v_{2,j}^2) &= \mathbb{E} \left(\left(\sum_{i=1}^D x_i^2 y_i^2 r_{ij}^2 + \sum_{i \neq i'} x_i^2 r_{ij} y_{i'}^2 r_{i'j} \right)^2 \right) \\
&= \mathbb{E} \left(\sum_{i=1}^D x_i^4 y_i^4 r_{ij}^4 + 2 \sum_{i \neq i'} x_i^2 y_i^2 r_{ij}^2 x_{i'}^2 y_{i'}^2 r_{i'j}^2 + \sum_{i \neq i'} x_i^4 r_{ij}^2 y_{i'}^4 r_{i'j}^2 \right) \\
&= \sum_{i=1}^D 3x_i^4 y_i^4 + 2 \sum_{i \neq i'} x_i^2 y_i^2 x_{i'}^2 y_{i'}^2 + \sum_{i \neq i'} x_i^4 y_{i'}^4 \\
&= \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + 2 \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2.
\end{aligned}$$

Similarly

$$\begin{aligned} \mathbb{E}(u_{3,j}^2 v_{1,j}^2) &= \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + 2 \left(\sum_{i=1}^D x_i^3 y_i \right)^2, \\ \mathbb{E}(u_{3,j}^2 v_{1,j}^2) &= \sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + 2 \left(\sum_{i=1}^D x_i y_i^3 \right)^2. \end{aligned}$$

$$\begin{aligned} &\mathbb{E}(u_{2,j} u_{3,j} v_{2,j} v_{1,j}) \\ &= \mathbb{E} \left(\sum_{i=1}^D x_i^2 r_{ij} \sum_{i=1}^D x_i^3 r_{ij} \sum_{i=1}^D y_i^2 r_{ij} \sum_{i=1}^D y_i r_{ij} \right) \\ &= \mathbb{E} \left(\left(\sum_{i=1}^D x_i^5 r_{ij}^2 + \sum_{i \neq i'} x_i^2 r_{ij} x_{i'}^3 r_{i'j} \right) \left(\sum_{i=1}^D y_i^3 r_{ij}^2 + \sum_{i \neq i'} y_i^2 r_{ij} y_{i'} r_{i'j} \right) \right) \\ &= \mathbb{E} \left(\sum_{i=1}^D x_i^5 y_i^3 r_{ij}^4 + \sum_{i \neq i'} x_i^5 r_{ij}^2 y_{i'}^3 r_{i'j}^2 \right) \\ &\quad + \mathbb{E} \left(\sum_{i \neq i'} x_i^2 y_i^2 r_{ij}^2 x_{i'}^3 y_{i'} r_{i'j}^2 + \sum_{i \neq i'} x_i^2 y_i r_{ij}^2 x_{i'}^3 y_{i'}^2 r_{i'j}^2 \right) \\ &= 3 \sum_{i=1}^D x_i^5 y_i^3 + \sum_{i \neq i'} x_i^5 y_{i'}^3 + \sum_{i \neq i'} x_i^2 y_i^2 x_{i'}^3 y_{i'} + \sum_{i \neq i'} x_i^2 y_i x_{i'}^3 y_{i'}^2 \\ &= \sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i^2 \sum_{i=1}^D x_i^3 y_i + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2. \end{aligned}$$

Similarly

$$\begin{aligned} &\mathbb{E}(u_{2,j} u_{1,j} v_{2,j} v_{3,j}) \\ &= \sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^2 y_i^2 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3, \\ &\mathbb{E}(u_{3,j} u_{1,j} v_{1,j} v_{3,j}) \\ &= \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^3 y_i + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3. \end{aligned}$$

Therefore,

$$\begin{aligned}
& \text{Var}(6u_{2,j}v_{2,j} - 4u_{3,j}v_{1,j} - 4u_{1,j}v_{3,j}) \\
&= 36 \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + 72 \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 \\
&+ 16 \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + 32 \left(\sum_{i=1}^D x_i^3 y_i \right)^2 \\
&+ 16 \sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + 32 \left(\sum_{i=1}^D x_i y_i^3 \right)^2 \\
&- 48 \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i^2 \sum_{i=1}^D x_i^3 y_i + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 \right) \\
&- 48 \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^2 y_i^2 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 \right) \\
&+ 32 \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^3 y_i + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 \right) \\
&- \left(6 \sum_{i=1}^D x_i^2 y_i^2 - 4 \sum_{i=1}^D x_i^3 y_i - 4 \sum_{i=1}^D x_i y_i^3 \right)^2
\end{aligned}$$

from which it follows that

$$\begin{aligned}
\text{Var}(\hat{d}_{(4)}) &= \frac{36}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 \right) \\
&+ \frac{16}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^3 y_i \right)^2 \right) \\
&+ \frac{16}{k} \left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i y_i^3 \right)^2 \right) \\
&- \frac{48}{k} \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 \right) \\
&- \frac{48}{k} \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 \right) \\
&+ \frac{32}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 \right)
\end{aligned}$$

B Proof of Lemma 3

It suffices to show that

$$\begin{aligned} & \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 \right) \\ & + \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 \right) \\ & - \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 \right) \geq 0. \end{aligned}$$

We need to use the arithmetic-geometric mean inequality:

$$\sum_{i=1}^n w_i \geq n \left(\prod_{i=1}^n w_i \right)^{1/n}, \quad \text{provided } w_i \geq 0.$$

Because

$$x_i^5 y_j^3 + x_i^3 y_j^5 \geq 2 \sqrt{x_i^8 y_j^8} = 2 x_i^4 y_j^4,$$

$$\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 - \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 \geq 0.$$

Thus it only remains to show that

$$\sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 - \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 \geq 0,$$

for which it suffices to show that

$$2 \sum_{i=1}^D x_i^{3/2} y_i^{3/2} \sum_{i=1}^D x_i^{5/2} y_i^{5/2} - \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 \geq 0,$$

or equivalently, to show that, if $z_i \geq 0 \forall i \in [1, D]$, then

$$f(z_i, i = 1, 2, \dots, D) = 2 \sum_{i=1}^D z_i^3 \sum_{i=1}^D z_i^5 - \sum_{i=1}^D z_i^2 \sum_{i=1}^D z_i^6 \geq 0. \quad (3)$$

Obviously, (3) holds for $D = 1$ and $D = 2$. To see that it is true for $D > 2$, we notice that only at $(z_1 = 0, z_2 = 0, \dots, z_D = 0)$, the first derivative of $f(z_i)$ is zero. We can also check that $f(z_i = 1, i = 1, 2, \dots, D) > 0$. Since $f(z_i)$ is a continuous function, we know $f(z_i) \geq 0$ must hold if $z_i > 0$ for all i . There is no need to worry about the boundary case that $z_j = 0$ and $z_i \geq 0$ because it is reduced to a small problem with $D' = D - 1$ and we have already shown the base case when $D = 1$ and $D = 2$. Thus, we complete the proof.

C Proof of Lemma 5

$$d_{(6)} = \sum_{i=1}^D x_i^6 + \sum_{i=1}^D y_i^6 - 20 \sum_{i=1}^D x_i^3 y_i^3 \\ + 15 \sum_{i=1}^D x_i^2 y_i^4 + 15 \sum_{i=1}^D x_i^4 y_i^2 - 6 \sum_{i=1}^D x_i^5 y_i - 6 \sum_{i=1}^D x_i y_i^5$$

$$\hat{d}_{(6)} = \sum_{i=1}^D x_i^6 + \sum_{i=1}^D y_i^6 + \frac{1}{k} \left(-20u_3^T v_3 + 15u_4^T v_2 + 15u_2^T v_4 - 6u_5^T v_3 - 6u_1^T v_5 \right) \\ = \sum_{i=1}^D x_i^6 + \sum_{i=1}^D y_i^6 + \frac{1}{k} \sum_{j=1}^k -20u_{3,j} v_{3,j} + 15u_{2,j} v_{4,j} + 15u_{4,j} v_{2,j} - 6u_{1,j} v_{5,j} - 6u_{5,j} v_{1,j}.$$

To derive the variance, we need to analyze the expectation of

$$\begin{aligned} & (-20u_{3,j} v_{3,j} + 15u_{2,j} v_{4,j} + 15u_{4,j} v_{2,j} - 6u_{1,j} v_{5,j} - 6u_{5,j} v_{1,j})^2 \\ &= 400u_{3,j}^2 v_{3,j}^2 + 225u_{2,j}^2 v_{4,j}^2 + 225u_{4,j}^2 v_{2,j}^2 + 36u_{1,j}^2 v_{5,j}^2 + 36u_{5,j}^2 v_{1,j}^2 \\ &\quad - 600u_{3,j} v_{3,j} u_{2,j} v_{4,j} - 600u_{3,j} v_{3,j} u_{4,j} v_{2,j} + 240u_{3,j} v_{3,j} u_{1,j} v_{5,j} \\ &\quad + 240u_{3,j} v_{3,j} u_{5,j} v_{1,j} + 450u_{2,j} v_{4,j} u_{4,j} v_{2,j} - 180u_{2,j} v_{4,j} u_{1,j} v_{5,j} \\ &\quad - 180u_{2,j} v_{4,j} u_{5,j} v_{1,j} - 180u_{4,j} v_{2,j} u_{1,j} v_{5,j} - 180u_{4,j} v_{2,j} u_{5,j} v_{1,j} \\ &\quad + 72u_{1,j} v_{5,j} u_{5,j} v_{1,j} \end{aligned}$$

Skipping the detail, we can show that

$$\begin{aligned} \mathbb{E} (u_{3,j}^2 v_{3,j}^2) &= \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + 2 \left(\sum_{i=1}^D x_i^3 y_i^3 \right)^2, \\ \mathbb{E} (u_{2,j}^2 v_{4,j}^2) &= \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^8 + 2 \left(\sum_{i=1}^D x_i^2 y_i^4 \right)^2, \\ \mathbb{E} (u_{4,j}^2 v_{2,j}^2) &= \sum_{i=1}^D x_i^8 \sum_{i=1}^D y_i^4 + 2 \left(\sum_{i=1}^D x_i^4 y_i^2 \right)^2, \\ \mathbb{E} (u_{1,j}^2 v_{5,j}^2) &= \sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^{10} + 2 \left(\sum_{i=1}^D x_i y_i^5 \right)^2, \\ \mathbb{E} (u_{5,j}^2 v_{1,j}^2) &= \sum_{i=1}^D x_i^{10} \sum_{i=1}^D y_i^2 + 2 \left(\sum_{i=1}^D x_i^5 y_i \right)^2. \end{aligned}$$

And

$$\begin{aligned}
& \mathbb{E}(u_{3,j}u_{2,j}v_{3,j}v_{4,j}) \\
&= \sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^7 + \sum_{i=1}^D x_i^3 y_i^3 \sum_{i=1}^D x_i^2 y_i^4 + \sum_{i=1}^D x_i^3 y_i^4 \sum_{i=1}^D x_i^2 y_i^3, \\
& \mathbb{E}(u_{3,j}u_{4,j}v_{3,j}v_{2,j}) \\
&= \sum_{i=1}^D x_i^7 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i^3 y_i^3 \sum_{i=1}^D x_i^4 y_i^2 + \sum_{i=1}^D x_i^3 y_i^2 \sum_{i=1}^D x_i^4 y_i^3, \\
& \mathbb{E}(u_{3,j}u_{1,j}v_{3,j}v_{5,j}) \\
&= \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^8 + \sum_{i=1}^D x_i^3 y_i^3 \sum_{i=1}^D x_i y_i^5 + \sum_{i=1}^D x_i^3 y_i^5 \sum_{i=1}^D x_i y_i^3, \\
& \mathbb{E}(u_{3,j}u_{5,j}v_{3,j}v_{1,j}) \\
&= \sum_{i=1}^D x_i^8 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i^3 y_i^3 \sum_{i=1}^D x_i^5 y_i^1 + \sum_{i=1}^D x_i^3 y_i^1 \sum_{i=1}^D x_i^5 y_i^3, \\
& \mathbb{E}(u_{2,j}u_{4,j}v_{4,j}v_{2,j}) \\
&= \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \sum_{i=1}^D x_i^2 y_i^4 \sum_{i=1}^D x_i^4 y_i^2 + \sum_{i=1}^D x_i^2 y_i^2 \sum_{i=1}^D x_i^4 y_i^4, \\
& \mathbb{E}(u_{2,j}u_{1,j}v_{4,j}v_{5,j}) \\
&= \sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^9 + \sum_{i=1}^D x_i^2 y_i^4 \sum_{i=1}^D x_i y_i^5 + \sum_{i=1}^D x_i^2 y_i^5 \sum_{i=1}^D x_i y_i^4, \\
& \mathbb{E}(u_{2,j}u_{5,j}v_{4,j}v_{1,j}) \\
&= \sum_{i=1}^D x_i^7 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i^2 y_i^4 \sum_{i=1}^D x_i^5 y_i + \sum_{i=1}^D x_i^2 y_i^5 \sum_{i=1}^D x_i^5 y_i^4, \\
& \mathbb{E}(u_{4,j}u_{1,j}v_{2,j}v_{5,j}) \\
&= \sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^7 + \sum_{i=1}^D x_i^4 y_i^2 \sum_{i=1}^D x_i y_i^5 + \sum_{i=1}^D x_i^4 y_i^5 \sum_{i=1}^D x_i y_i^2, \\
& \mathbb{E}(u_{4,j}u_{5,j}v_{2,j}v_{1,j}) \\
&= \sum_{i=1}^D x_i^9 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^4 y_i^2 \sum_{i=1}^D x_i^5 y_i + \sum_{i=1}^D x_i^4 y_i^5 \sum_{i=1}^D x_i^5 y_i^2, \\
& \mathbb{E}(u_{1,j}u_{5,j}v_{5,j}v_{1,j}) \\
&= \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \sum_{i=1}^D x_i y_i^5 \sum_{i=1}^D x_i^5 y_i + \sum_{i=1}^D x_i y_i^5 \sum_{i=1}^D x_i^5 y_i^5,
\end{aligned}$$

Combining the results, we obtain

$$\begin{aligned}
\text{Var}(\hat{d}_{(6)}) &= \frac{400}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i^3 y_i^3 \right)^2 \right) \\
&+ \frac{225}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^8 + \left(\sum_{i=1}^D x_i^2 y_i^4 \right)^2 \right) \\
&+ \frac{225}{k} \left(\sum_{i=1}^D x_i^8 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^4 y_i^2 \right)^2 \right) \\
&+ \frac{36}{k} \left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^{10} + \left(\sum_{i=1}^D x_i y_i^5 \right)^2 \right) \\
&+ \frac{36}{k} \left(\sum_{i=1}^D x_i^{10} \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^5 y_i \right)^2 \right) + \Delta_6
\end{aligned}$$

where

$$\begin{aligned}
k\Delta_6/6 &= -100 \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^7 + \sum_{i=1}^D x_i^3 y_i^4 \sum_{i=1}^D x_i^2 y_i^3 \right) \\
&- 100 \left(\sum_{i=1}^D x_i^7 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i^3 y_i^2 \sum_{i=1}^D x_i^4 y_i^3 \right) \\
&+ 40 \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^8 + \sum_{i=1}^D x_i^3 y_i^5 \sum_{i=1}^D x_i y_i^3 \right) \\
&+ 40 \left(\sum_{i=1}^D x_i^8 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i^3 y_i \sum_{i=1}^D x_i^5 y_i^3 \right) \\
&+ 75 \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \sum_{i=1}^D x_i^2 y_i^2 \sum_{i=1}^D x_i^4 y_i^4 \right) \\
&- 30 \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^9 + \sum_{i=1}^D x_i^2 y_i^5 \sum_{i=1}^D x_i y_i^4 \right) \\
&- 30 \left(\sum_{i=1}^D x_i^7 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^5 y_i^4 \right) \\
&- 30 \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^7 + \sum_{i=1}^D x_i^4 y_i^5 \sum_{i=1}^D x_i y_i^2 \right) \\
&- 30 \left(\sum_{i=1}^D x_i^9 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^4 y_i \sum_{i=1}^D x_i^5 y_i^2 \right) \\
&+ 12 \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^6 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^5 y_i^5 \right).
\end{aligned}$$

D Proof of Lemma 6

$$\begin{aligned}\hat{d}_{(4),s} &= \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} \left(6u_2^\top v_2 - 4u_3^\top v_1 - 4u_1^\top v_3 \right) \\ &= \sum_{i=1}^D x_i^4 + \sum_{i=1}^D y_i^4 + \frac{1}{k} \left(\sum_{j=1}^k 6u_{2,j}v_{2,j} - 4u_{3,j}v_{1,j} - 4u_{1,j}v_{3,j} \right)\end{aligned}$$

$$\begin{aligned}\mathbb{E}(u_{2,j}^2 v_{2,j}^2) &= \mathbb{E} \left(\left(\sum_{i=1}^D x_i^2 y_i^2 r_{ij}^2 + \sum_{i \neq i'} x_i^2 r_{ij} y_{i'}^2 r_{i'j}^2 \right)^2 \right) \\ &= \mathbb{E} \left(\sum_{i=1}^D x_i^4 y_i^4 r_{ij}^4 + 2 \sum_{i \neq i'} x_i^2 y_i^2 r_{ij}^2 x_{i'}^2 y_{i'}^2 r_{i'j}^2 + \sum_{i \neq i'} x_i^4 r_{ij}^2 y_{i'}^4 r_{i'j}^2 \right) \\ &= \sum_{i=1}^D s x_i^4 y_i^4 + 2 \sum_{i \neq i'} x_i^2 y_i^2 x_{i'}^2 y_{i'}^2 + \sum_{i \neq i'} x_i^4 y_{i'}^4 \\ &= \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + 2 \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 + (s-3) \sum_{i=1}^D x_i^4 y_i^4.\end{aligned}$$

Similarly,

$$\begin{aligned}\mathbb{E}(u_{3,j}^2 v_{1,j}^2) &= \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + 2 \left(\sum_{i=1}^D x_i^3 y_i \right)^2 + (s-3) \sum_{i=1}^D x_i^6 y_i^2, \\ \mathbb{E}(u_{3,j}^2 v_{1,j}^2) &= \sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + 2 \left(\sum_{i=1}^D x_i y_i^3 \right)^2 + (s-3) \sum_{i=1}^D x_i^2 y_i^6.\end{aligned}$$

$$\begin{aligned}\mathbb{E}(u_{2,j} u_{3,j} v_{2,j} v_{1,j}) &= \sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i^2 \sum_{i=1}^D x_i^3 y_i \\ &\quad + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 + (s-3) \sum_{i=1}^D x_i^5 y_i^3, \\ \mathbb{E}(u_{2,j} u_{1,j} v_{2,j} v_{3,j}) &= \sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^2 y_i^2 \\ &\quad + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 + (s-3) \sum_{i=1}^D x_i^3 y_i^5, \\ \mathbb{E}(u_{3,j} u_{1,j} v_{1,j} v_{3,j}) &= \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^3 y_i \\ &\quad + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 + (s-3) \sum_{i=1}^D x_i^4 y_i^4.\end{aligned}$$

Therefore,

$$\begin{aligned}
& \text{Var}(6u_{2,j}v_{2,j} - 4u_{3,j}v_{1,j} - 4u_{1,j}v_{3,j}) \\
&= 36 \sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + 72 \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 + 36(s-3) \sum_{i=1}^D x_i^4 y_i^4 \\
&+ 16 \sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + 32 \left(\sum_{i=1}^D x_i^3 y_i \right)^2 + 36(s-3) \sum_{i=1}^D x_i^6 y_i^2 \\
&+ 16 \sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + 32 \left(\sum_{i=1}^D x_i y_i^3 \right)^2 + 36(s-3) \sum_{i=1}^D x_i^2 y_i^6 \\
&- 48 \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i^2 \sum_{i=1}^D x_i^3 y_i + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 + (s-3) \sum_{i=1}^D x_i^5 y_i^3 \right) \\
&- 48 \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^2 y_i^2 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 + (s-3) \sum_{i=1}^D x_i^3 y_i^5 \right) \\
&+ 32 \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i^3 \sum_{i=1}^D x_i^3 y_i + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 + (s-3) \sum_{i=1}^D x_i^4 y_i^4 \right) \\
&- \left(6 \sum_{i=1}^D x_i^2 y_i^2 - 4 \sum_{i=1}^D x_i^3 y_i - 4 \sum_{i=1}^D x_i y_i^3 \right)^2
\end{aligned}$$

from which it follows that

$$\begin{aligned}
\text{Var}(\hat{d}_{(4),s}) &= \frac{36}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \left(\sum_{i=1}^D x_i^2 y_i^2 \right)^2 + (s-3) \sum_{i=1}^D x_i^4 y_i^4 \right) \\
&+ \frac{16}{k} \left(\sum_{i=1}^D x_i^6 \sum_{i=1}^D y_i^2 + \left(\sum_{i=1}^D x_i^3 y_i \right)^2 + (s-3) \sum_{i=1}^D x_i^6 y_i^2 \right) \\
&+ \frac{16}{k} \left(\sum_{i=1}^D x_i^2 \sum_{i=1}^D y_i^6 + \left(\sum_{i=1}^D x_i y_i^3 \right)^2 + (s-3) \sum_{i=1}^D x_i^2 y_i^6 \right) \\
&- \frac{48}{k} \left(\sum_{i=1}^D x_i^5 \sum_{i=1}^D y_i^3 + \sum_{i=1}^D x_i^2 y_i \sum_{i=1}^D x_i^3 y_i^2 + (s-3) \sum_{i=1}^D x_i^5 y_i^3 \right) \\
&- \frac{48}{k} \left(\sum_{i=1}^D x_i^3 \sum_{i=1}^D y_i^5 + \sum_{i=1}^D x_i y_i^2 \sum_{i=1}^D x_i^2 y_i^3 + (s-3) \sum_{i=1}^D x_i^3 y_i^5 \right) \\
&+ \frac{32}{k} \left(\sum_{i=1}^D x_i^4 \sum_{i=1}^D y_i^4 + \sum_{i=1}^D x_i y_i \sum_{i=1}^D x_i^3 y_i^3 + (s-3) \sum_{i=1}^D x_i^4 y_i^4 \right)
\end{aligned}$$
